# Networking

- Μέχρι τώρα έχουμε φτιάξει δύο ιδεατές μηχανές
- Μία που είναι o client (xubuntu)
- Η άλλη είναι o server (debian)
- Πως αυτά βλέπουν το ένα το άλλο;

# Bridged Networking

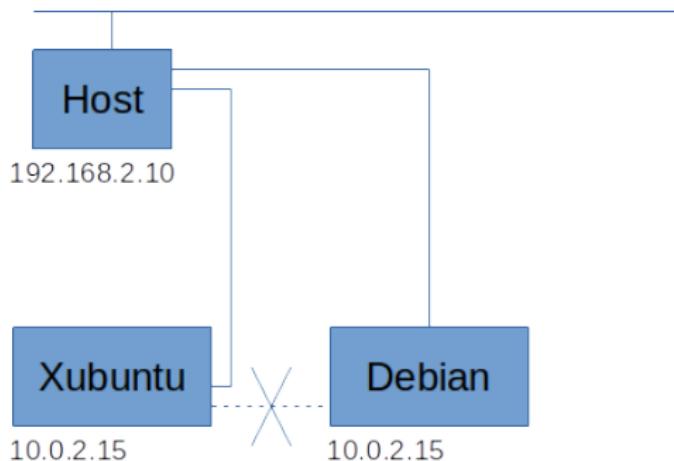

```

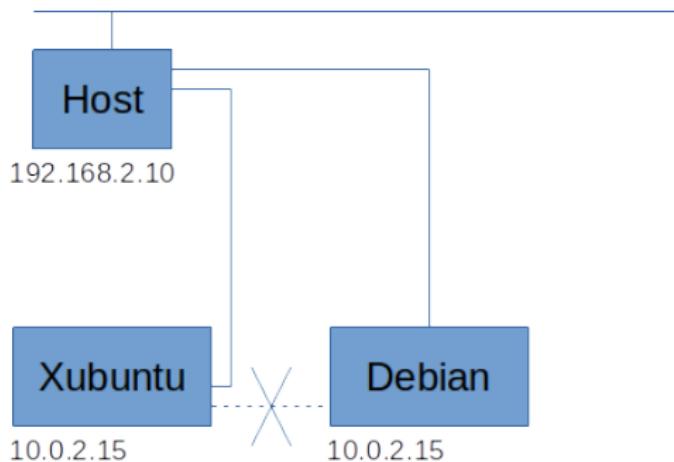

debian:~$ cat /proc/net/bridge/bridge
bridge: 0: br0: 00:0c:29:35:b7 brd 00:0c:29:35:b7:00 state UP group default
link: br0: brd 00:0c:29:35:b7:00 state UNKNOWN group default

                                                    br0: 192.168.2.103 brd 192.168.2.255 scope global dynamic
                                                        br0: 192.168.2.103 brd 192.168.2.255 scope global dynamic
                                                            br0: 192.168.2.103 brd 192.168.2.255 scope global dynamic
                                                                br0: 192.168.2.103 brd 192.168.2.255 scope global dynamic
                                                                    br0: 192.168.2.103 brd 192.168.2.255 scope global dynamic
                                                                        br0: 192.168.2.103 brd 192.168.2.255 scope global dynamic
                                
```

The screenshot shows two terminal windows running on a Debian system. Both windows display the output of the `cat /proc/net/bridge/bridge` command, which lists a bridge interface (br0) with various statistics and configurations. The IP address 192.168.2.103 is visible in several places within the output, indicating its association with the bridge.

# Εγκατάσταση του Atom

- Κατεβάζουμε το .deb αρχείο στο Xubuntu και γράφουμε σε ένα terminal [`lsinline|sudo dpkg -i atom-amd64.deb`].

# Hello world!

- Φτιάχνουμε ένα αρχείο helloworld.py στον Atom που περιέχει μόνο μία εντολή
- print('Hello world!')
- το τρέχουμε με python3 helloworld.py στο terminal

The screenshot shows the Atom code editor interface. The menu bar includes File, Edit, View, Selection, Find, Packages, and Help. A 'Project' sidebar on the left shows a folder named 'lecture3' containing a file named 'helloworld.py'. The main editor area displays the following code:

```
helloworld.py
1 print('Hello World')
2
```

```
thomas@kirkaptop:~/Documents/mscpython/code/lecture3$ python3 helloworld.py
Hello World
thomas@kirkaptop:~/Documents/mscpython/code/lecture3$
```

## Hello world - C

```
#include <stdio.h>

int main() {
    printf("Hello World");
    return 0;
}
```

## Hello world - C++

```
#include <iostream>

int main() {
    std::cout << "Hello World"
    return 0;
}
```

## Hello world - C#

```
namespace HelloWorld
{
    class Hello {
        static void Main(string[] args)
        {
            System.Console.WriteLine("Hello World");
        }
    }
}
```

## Hello world - COBOL

```
IDENTIFICATION DIVISION.  
PROGRAM-ID. Hello-world.  
PROCEDURE DIVISION.  
    DISPLAY "Hello World".
```

## Hello world - Java

```
/*
 * package whatever //do not write package name here */

import java.io.*;

class GFG {
    public static void main (String[] args) {
        System.out.println("Hello World");
    }
}
```

# Hello world - Javascript

```
console.log("Hello World");
```

# Ιστορία

- Ξεκινάει το 1989 από τον Guido van Rossum
- Θεωρείται Benevolent dictator for life
- Πήρε το όνομα της από τους Monty Python
- Η έκδοση 2.0 ξεκίνησε το 2000
- Το 2008 βγήκε η έκδοση 3.0
- Προσοχή! Ποτέ δεν γράφουμε Python 2!

## Zen of Python

- Beautiful is better than ugly.
- Explicit is better than implicit.
- Simple is better than complex.
- Complex is better than complicated.
- Flat is better than nested.
- Sparse is better than dense.
- Readability counts.
- Special cases aren't special enough to break the rules.
- Although practicality beats purity.

## Zen of Python

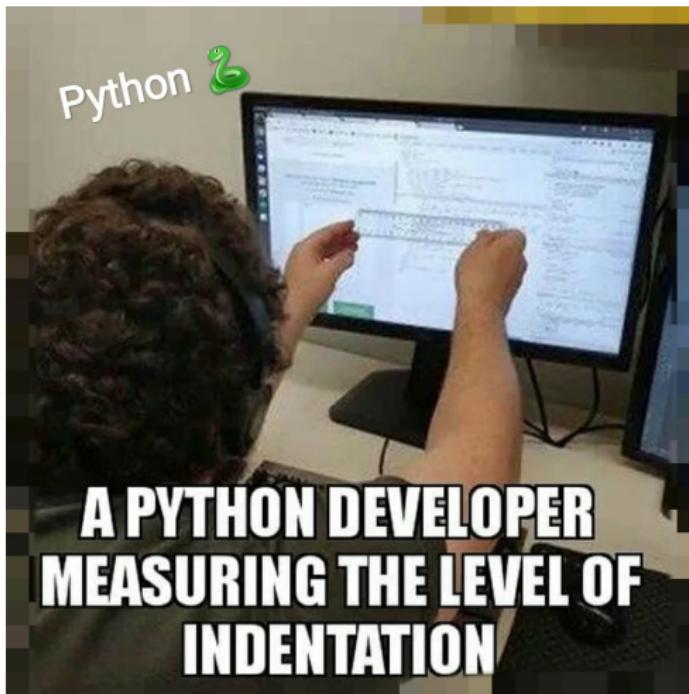

- Errors should never pass silently.
- Unless explicitly silenced.
- In the face of ambiguity, refuse the temptation to guess.
- There should be one— and preferably only one –obvious way to do it.
- Although that way may not be obvious at first unless you're Dutch.
- Now is better than never.
- Although never is often better than *\*right\** now.
- If the implementation is hard to explain, it's a bad idea.
- If the implementation is easy to explain, it may be a good idea.
- Namespaces are one honking great idea – let's do more of those!

# Μεταβλητές

- Μία μεταβλητή είναι κάτι που μπορεί να αλλάξει μέσα στο πρόγραμμα.
- Στην Python υπάρχουν διάφορα είδη μεταβλητών
- ακέραια μεταβλητή (int)
- μεταβλητή πραγματικού αριθμού (float)
- αλφαριθμητική μεταβλητή (string)
- μπορούμε να χρησιμοποιήσουμε και πιο πολύπλοκους τύπους μεταβλητών

# Μεταβλητές

```
1 x = 1          # Integer
2 s = 'Thomas'   # String
3 S = "Thomas"   # String
4 y = 1.2        # Float
5
6 # Check out variable types
7 print( 'x is: ', type(x) )
8 print( 's is: ', type(s) )
9 print( 'S is: ', type(S) )
10 print( 'y is: ', type(y) )
```

```
thomas@kirklaptop:~/Documents/mscpython/code/lecture3$ python3 variables.py
x is: <class 'int'>
s is: <class 'str'>
S is: <class 'str'>
y is: <class 'float'>
```

# Μεταβλητές

```
1 """
2 Simultaneous assignments
3 """
4 x, y, z = 0, "Thomas", 1.2
5
6 print(x)
7 print(y)
8 print(z)
```

```
thomas@kirklaptop:~/Documents/mscpython/code/lecture3$ python3 variables2.py
0
Thomas
1.2
```

## Μεταβλητές - Casting

- Μπορούμε να αλλάξουμε τον τύπο μίας μεταβλητής, π.χ. από string σε ακέραιο.

```
1 """
2 Casting of variables
3 """
4 x = 2
5 s = str(x)
6 print( type(s) )
7 print(s)
8
9 S = "4"
10 y = int(S)
11 print( type(y) )
12 print(y)
```

```
thomas@kirkoffice:~/Documents/mscpython/code/lecture3$ python3 casting.py
<class 'str'>
2
<class 'int'>
4
```

## Strings - Ανάθεση

```
1 """
2 Strings
3 """
4 s = "Thomas"
5 print(s)
6
7 S = """
8 Thomas
9 Kamalakis
10 """
11 print(S)
```

```
Thomas
Thomas
Kamalakis
```

# Τμήματα από strings

- Μπορούμε να πάρουμε τμήματα από ένα string
- $s[i]$ , ο  $i+1$  χαρακτήρας.
- $s[i:j]$ , το string μεταξύ του  $(i+1)$  και του  $j$  χαρακτήρα.
- $s[i:]$ , το string μεταξύ του  $(i+1)$  και του τελευταίου χαρακτήρα.
- $s[:j]$ , το string μεταξύ του πρώτου και του  $j$  χαρακτήρα.

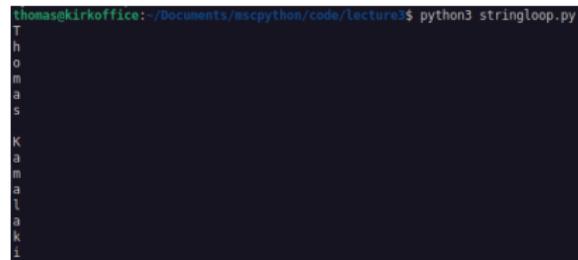

```
1 """
2 Slicing Strings
3 """
4 s = "Thomas Kamalakis"
5 print(s)
6
7 print(s[1])
8 print(s[1:5])
9 print(s[:5])
10 print(s[5:])
```

```
thomas@kirkoffice:~/Documents/mscpython/code/lecture3$ python3 slicingstrings.py
Thomas Kamalakis
h
homa
Thoma
s Kamalakis
```

## String loops

- Μπορούμε να αναθέσουμε σε μία μεταβλητή τους διαδοχικούς χαρακτήρες ενός string.

```
1 """
2 String Loops
3 """
4
5 S = "Thomas Kamalakis"
6 for x in S:
7     print(x)
```

A terminal window showing the execution of a Python script named `stringloop.py`. The script contains a single-line string assignment and a for-loop that iterates over each character in the string, printing it to the console. The output shows the characters of the string `Thomas Kamalakis` printed one by one.

```
thomas@kirkoffice:~/Documents/mscpython/code/lecture$ python3 stringloop.py
T
h
o
m
a
s
K
a
m
a
l
a
k
i
```

# String in String

- μπορούμε να ελέγξουμε αν ένα string περιέχεται σε ένα άλλο string

```
1 """
2 String in String
3 """
4
5 S = "Thomas Kamalakis"
6 s = "Thomas"
7 if s in S:
8     print(s, 'is contained in', S)
9 else:
10    print(s, 'is not contained in', S)
11
